Miroslav Bernát
Senior Linux/Unix Engineer | Red Hat Certified Architect

I am a Linux and automation enthusiast and would like to share my experience and knowledge with other people who are interested in the same thing.

I started with Linux in 2004. It was my first operating system (Fedora Core 2). I must say that until then I didn't like computers, I didn't understand them and I never thought that I would work with them one day. And it happened. When I was looking for a new job at the time, I was thinking about what field had a future and I realized that, among other things, it was computers and that I could perhaps change my attitude towards them. It wasn't easy at the beginning, but over time, when I started to find out what possibilities they offer, my interest in them, and especially in Linux, grew. However, I wanted to learn much more than is sufficient for average users. I was trying new and new commands and kept writing them down in notes so that I would have them at hand when needed, without having to search for anything extensively on the internet or in the manual pages. As the information increased, I needed to categorize it for clarity, in short, to have a certain system in it. But soon the notes in the file were no longer enough for me, I wanted to have them available online. At the same time, it occurred to me that I could actually share them with others, so around 2006 this website started to take shape. At first, it operated from my home web server, and only about three years later, I registered a domain and arranged hosting. The original domain was called linuxvbashi.cz, which was replaced by prompt.cz in 2020.

I dedicate almost all of my free time to the website. I add new information, update the existing one, and I try to present everything in an understandable way, including the use of practical examples. I don't use any cookies, pop-ups, or ads. So, if you like my website and want to support it, you can contribute to its operation via the **"DONATE"** button at the bottom of this page.

In addition to various Linux distributions, such as RedHat, CentOS, Fedora, SUSE, Debian or Ubuntu, I also have experience with Unix systems (AIX, HP-UX, Solaris), databases (MySQL, Oracle), automation programs (Ansible, Puppet , Red Hat Satellite), DevOps tools (Containers, Kubernetes, OpenShift, Git) and partially also with programming in Python. I enjoy both creative work and solving complex problems. In any case, I always need to see at least a good result behind my work. In my opinion, the future is primarily in automation, and I intend to continue in this direction.
